[High-gain Pw-dn4210d Driver 25](#)

What's in the box?

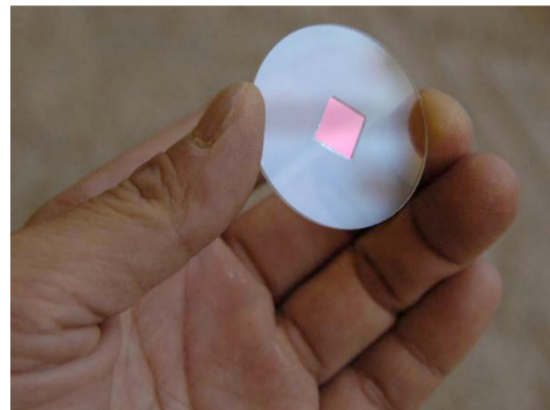

The DSI comes with (clockwise from top left):

- DSI camera body
- RJ to DB9 adapter
- eyepiece parfocalizing ring
- Autostar Suite CDROM
- Quickstart instructions
- 4 wire RJ cable
- 6 wire RJ cable
- USB cable

Everything you need to use the DSI is supplied in the box, including a built-in IR filter. The camera body is a nicely machined block of metal with a standard 1.25" nosepiece, threaded for 1.25" filters.

The nosepiece unscrews to reveal the unusual IR filter sitting below the nosepiece. Unlike a regular 1.25" or 2" filter, it's a flat disk of glass with a rectangular IR block area that fits over the CCD sensor. The quickstart instructions warn to remove the nosepiece carefully, as the filter is loose. If you plan on taking the filter in and out a lot, you might want to invest in a regular 1.25" screw-in filter for the front of the nosepiece.

The specifications say that the sensor is a "High Sensitivity Sony Super HAD Color CCD", and specifies the pixels as 9.6x7.5 microns, in an array of 510 x 492 pixels. The use of the HAD CCD is good news as they are known to have good sensitivity with low dark current (thermal noise). The pixel size is larger than the ones in the ubiquitous Philips TouCam Pro, so it's not the same sensor, although from the same family of sensors.

Exposure time capability is listed as being from 1/10,000s to 1 hour.

One of the benefits of the Meade ground-up design, rather than modifying an existing webcam, is that long-exposure control does not necessitate a separate parallel cable – everything is controlled through one convenient USB cable.
